

# Smart Campus Visitor Management System

DocMind Test Document — Structured for PDF Question Answering

## 1. Project Overview

The Smart Campus Visitor Management System is a digital platform designed to manage visitors entering a college campus. The system replaces paper-based visitor registers with a secure appointment and QR-code verification process. It allows authorized users to create visitor appointments, while security staff can verify the visitor before granting entry.

## 2. Main Objectives

- Reduce manual visitor registration at campus entrances.
- Provide a faster and more organized visitor check-in process.
- Use QR codes to identify approved visitor appointments.
- Maintain a digital record of visitor entry and exit times.
- Improve campus security by allowing only verified visitors to enter.

## 3. System Users

| User           | Responsibilities                                                                  |
|----------------|-----------------------------------------------------------------------------------|
| Administrator  | Manages the system, verifies visitors, and monitors visitor activity.             |
| Host           | Creates an appointment for a visitor and provides the required visit information. |
| Visitor        | Views the assigned appointment/QR code and presents it at the entrance.           |
| Security Staff | Scans the QR code, verifies the appointment, and records entry or exit.           |

## 4. Visitor Registration Process

A host first creates a visitor appointment by entering the visitor's name, phone number, purpose of visit, expected date, and expected arrival time. After the appointment is approved, the system generates a unique QR code. The visitor can access the QR code from the application and present it to security staff at the campus entrance.

## 5. QR Verification

The QR code contains a unique appointment identifier rather than relying on a handwritten entry. When security staff scan the code, the system checks whether the appointment exists, whether it is valid for the current date, and whether it has already been used. If the verification succeeds, the visitor's entry time is recorded.

## 6. Security Rules

- An invalid or unknown QR code must be rejected.
- A QR code belonging to an expired appointment must not permit entry.
- A QR code already marked as used must not be accepted for a second entry.
- Only authorized administrators and security staff can access visitor verification functions.
- Visitor information should be protected from unauthorized access.

## 7. Example Visitor Record

| Field            | Example Value      |
|------------------|--------------------|
| Visitor Name     | Rahul Kumar        |
| Appointment ID   | VIS-2026-0148      |
| Purpose          | Project discussion |
| Host             | Dr. Ananya Rao     |
| Visit Date       | 15 September 2026  |
| Expected Arrival | 10:30 AM           |
| Status           | Approved           |

## 8. Frequently Asked Questions

**Q: Who creates a visitor appointment?**

A: The host creates the appointment by entering the visitor and visit details.

**Q: Who verifies the visitor?**

A: Security staff or an authorized administrator verifies the visitor at the entrance.

**Q: What is the purpose of the QR code?**

A: The QR code provides a unique digital identifier for the approved appointment.

**Q: What happens if a QR code is expired?**

A: The system rejects the QR code and the visitor is not admitted through the normal verification process.

**Q: Can the same QR code be reused?**

A: No. After an appointment is marked as used according to the system's rules, the same code should not be accepted again.

**Q: What information is recorded at entry?**

A: The system can record the visitor identity, appointment ID, date, time, and verification result.

## 9. Important Numbers for Testing

| Metric                                | Value      |
|---------------------------------------|------------|
| Maximum standard appointment duration | 2 hours    |
| QR validity window before arrival     | 30 minutes |
| Example security desk ID              | SEC-07     |

|                                               |             |
|-----------------------------------------------|-------------|
| Example appointment capacity per host per day | 20 visitors |
|-----------------------------------------------|-------------|

## 10. Test Questions for DocMind

- What are the main objectives of the Smart Campus Visitor Management System?
- What are the responsibilities of the administrator?
- Who creates a visitor appointment?
- What information is recorded for Rahul Kumar?
- What happens when an expired QR code is scanned?
- How long is the standard appointment duration?
- What is the example security desk ID?
- Can a used QR code be accepted again?
- What information can be recorded at visitor entry?
- What is the appointment ID for Rahul Kumar?
